NGSII: Variant Annotation

Selecting the most relevant variants: How to filter

Stephan Pabinger et al. Brief Bioinform 2013;bib.bbs086

Variant annotation

- Technical information: quality parameters, filters, …
- Descriptive information: nomenclature, genotype, …
- Functional annotation: consequence, functional prediction, …
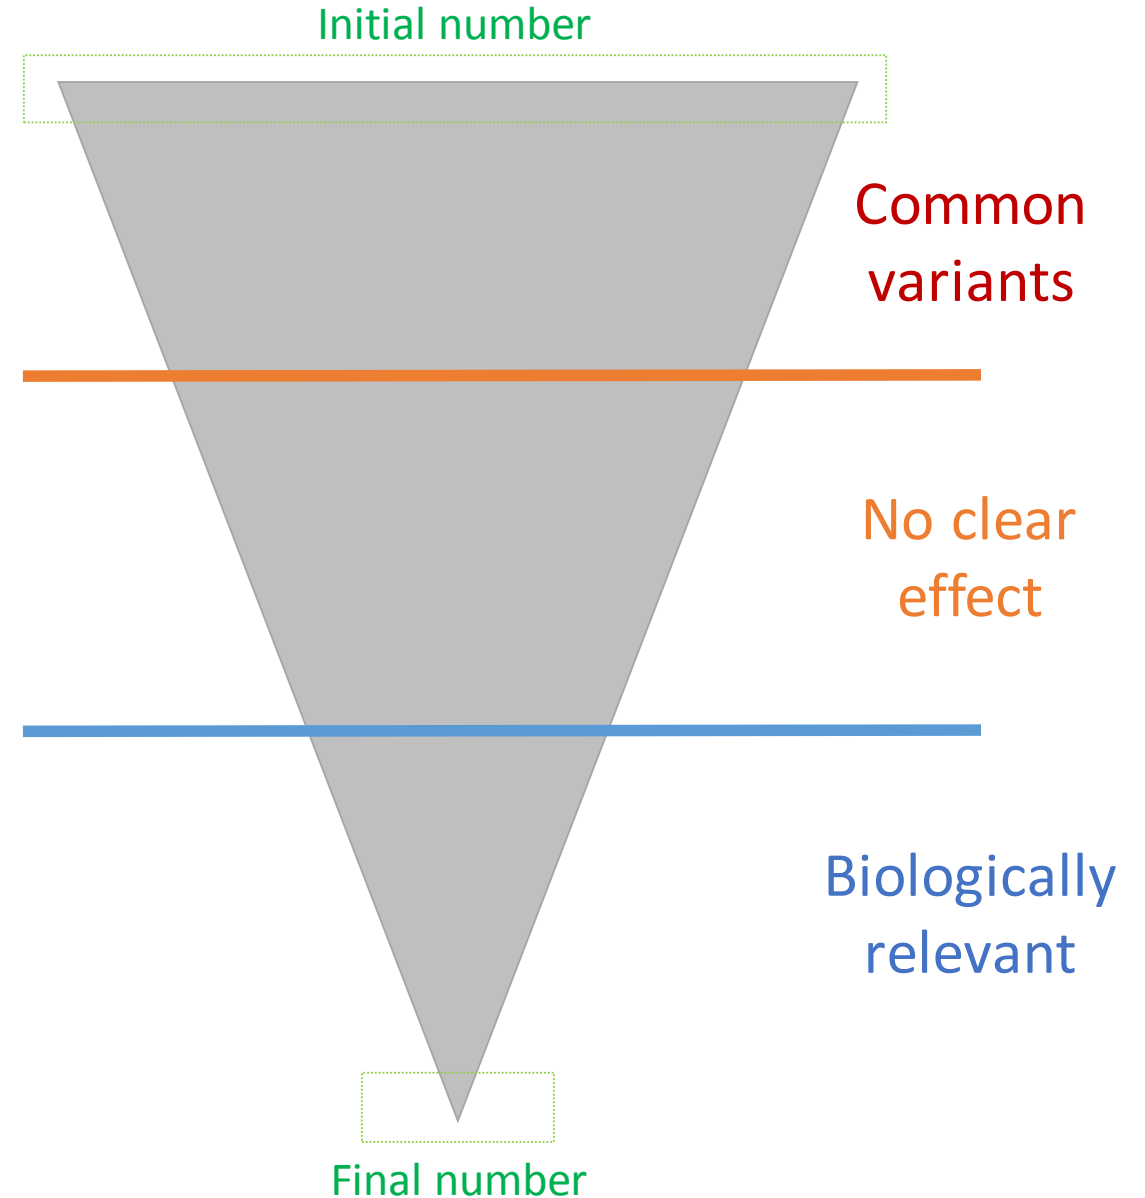

Variant callers provide technical parameters associated to each variant, that allow us to remove sequencing artifacts and select the most reliable variants.

Variant annotation

Not all the variants have a relevant impact in the phenotype of study. They are mainly polymorphisms (maybe predisposition) or variants without a clear effect.

To identify and select the most relevant variants we need to add descriptive and functional annotations.

There are different software programs that perform variant annotation.

Annotations about consequence: Functional impact prediction

SIFT PREDICTION (--sift [p|s|b]) predicts whether an amino acid substitution affects protein function based on sequence homology and the physical properties of amino acids. The VEP can output the **p**rediction term, **s**core or **b**oth

Deleterious – Tolerated

< 0.05 Deleterious

PolyPhen PREDICTION (--polyphen [p|s|b]) predicts the possible impact of an amino acid substitution on the structure and function of a human protein using straightforward physical and comparative considerations. The VEP can output the **p**rediction term, **s**core or **b**oth.

Probably damaging - Possibly damaging - Benign – Unknown

Benign < ~0.435 < Damaging
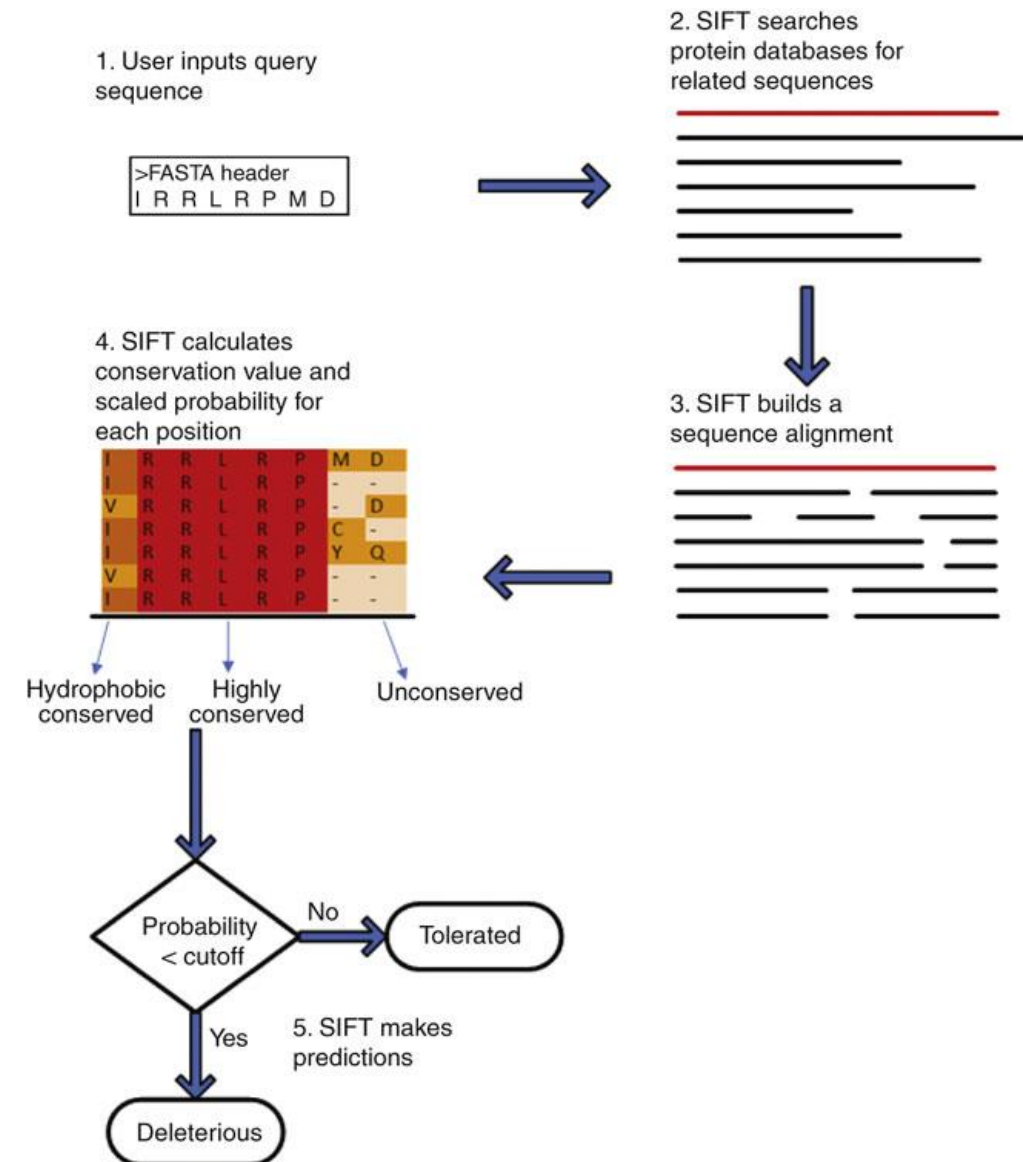

Annotations about consequence: Functional impact prediction

The built-in functionality in VEP of these predictors allows only the prediction of coding non-synonymous SNV

CONDEL (--plugin) Condel **CONsensus DELeteriousness score** runs an adapted version of CONDEL computing a score based on pre-calculated SIFT and PolyPhen-2 scores from the Ensembl API.

1. User inputs query sequence

>FASTA header
I R R L R P M D

2. SIFT searches protein databases for related sequences

3. SIFT builds a sequence alignment

4. SIFT calculates conservation value and scaled probability for each position

Hydrophobic conserved   Highly conserved   Unconserved

Probability < cutoff

No → Tolerated

Yes → Deleterious

5. SIFT makes predictions
